

Mitigation of multiple UAS threats

PiuPiuDefense

Challenge

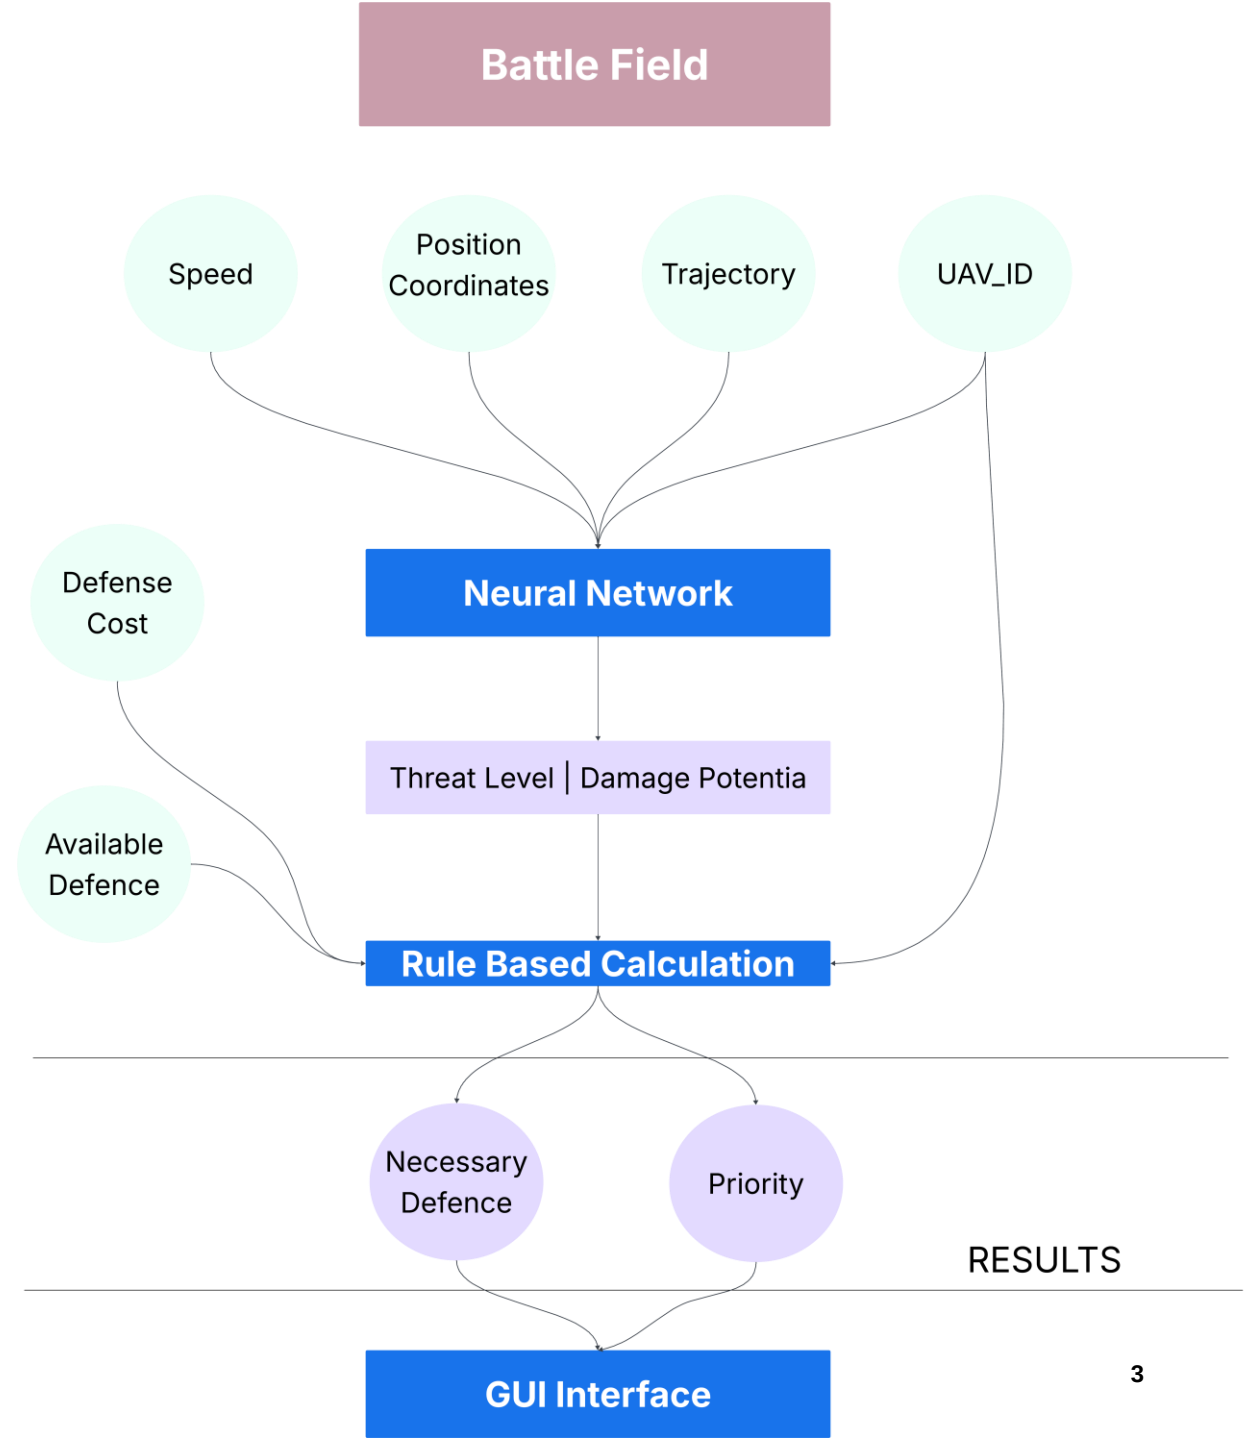

- simultaneous, diverse UAS threats require the **right** countermeasures;
- opponents deliberate mixing low-cost and high-end threats to force defenders into misusing expensive assets;
- Result: exhausting and wasting defensive capacity over time for insignificant targets;

Our idea: methodology to tackle this issue: ML based threat prioritization and simulation

Approach

- Use sensor data to train an **AI model** to predict the threat's level and potential damage;
- Based on these predictions, **prioritize threats** and **decide** on the necessary counter-defense mechanism;
- Generate a simulation to visualize the threats, the targets and their trajectories;

Time for demo!

Conclusion

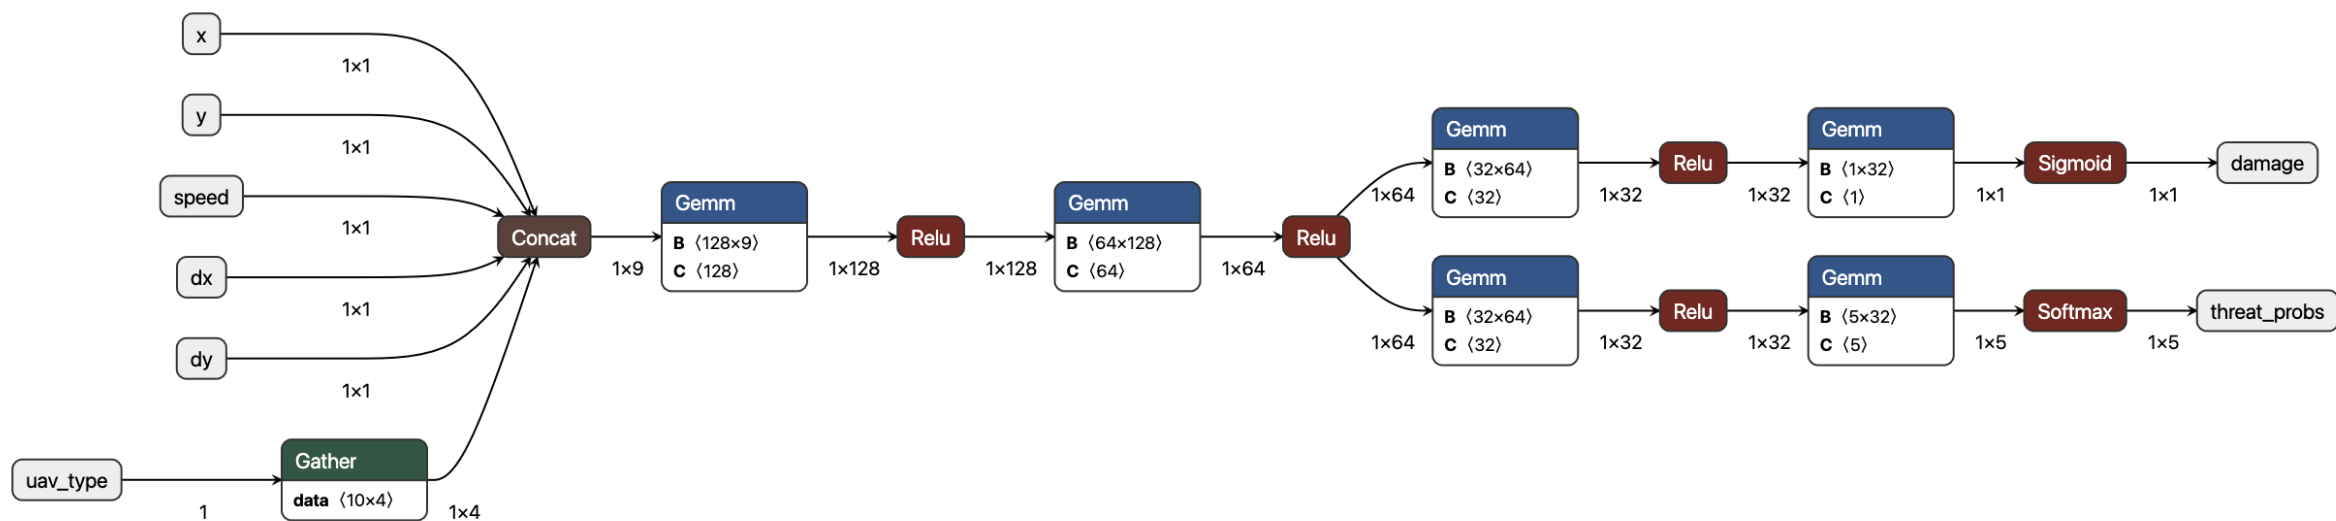

- Our delta: we went ***from zero to hero*** from Friday to today!
- We designed a novel approach for multiple UAS threats
- We had the opportunity to work on a real world challenge
- We built our first drones!
- We got more accustomed to tech defense challenges

Thank you! Questions?

PIUPIUDEFENSE

Approach - NN

Business Model

- **B2B business model:** selling the end product (i.e. GUI interface)
- **Customers:** military entities in Governments
- **Selling point:** enabling the military to reduce war costs and save expensive equipment
- **Revenue & Pricing:** subscription-based model
